PT nucleic acids encoding related receptor subunits.

PT nucleic acids encoding related (079372) and subunit acceptor of all a.

PT nucleic acids encoding related (079372) with the exception of all a.

PT nucleic acids encoding related (079372) with the exception of all a.

PT nucleic acids encoding related (079372) with the exception of all a.

PT nucleic acids encoding related (079372) with the exceptor acide of the NMDAR2 (079378).

PT nucleic acids encoding related (079402). The clones are thought to be splice variants of each other. Based on the sequence of the 4 clones, a series of variants (079403-7) of the NMDAR2 receptor were constructed.

PT nucleic acids encoding the penes allows the reconstruction of the NMDAR compounds which be human numbar receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               멍

PS CL (NMDAP2C) gene clone NMDAR2C relata15-delta51. This clone covers the same sequence as the NMDAR2C relata15-delta51. This clone covers the Same sequence as the NMDAR2C receptor were constructed, by recombination, CC (079403-7) of the NMDAR2C receptor were constructed, by recombination, Dassed on the sequence of the 4 basic clones: NMDA21 (079399), NMDA22 (079401) and NMDA26 (079402). The NMDA receptor CC (079400), NMDA26 (079401) and NMDA26 (079402). The NMDA receptor CC (079400), NMDA26 (079375), DB (079377), DC and DD (079378). The receptor CC forms part of a family of NMDA receptors which have cation selective channels and bind glutamate and NMDA. The expression of the genes allows the reconstruction of the NMDA receptor. The complete receptor can be used to identify compounds which bind or are antagonistic to the human CC NMDA receptor.
                                                                                                                                                                                                                                  PT Isolated DNA encoding a human N-methyl-D-aspartate receptor
PT subunit - used as probes in the identification and isolation of
PT nucleic acids encoding related receptor subunits.
PT nucleic acids encoding related receptor subunits.
PS Claim II; Page 99-104; 156pp; English.

CC receptor receptor sequence of the novel N-methyl-D-aspartate (NMDA) receptor
CC c(NMDAR2C) gene clone pCMV-26-Scal-21-NocLI-24. This clone covers the
CC c(NMDAR2C) gene clone pCMV-26-Scal-21-NocLI-24. This clone covers the
CC come sequence as the NMDAR2C sequence but contains a deletion of a.a.
CC come sequence as the NMDAR2C sequence but contains a deletion of a.a.
CC contains the NMDAR2C protein (R66035). A series of variants (079403-7)
CC of the NMDAR2C protein (R66035). A series of variants (079403-7)
CC of the NMDAR2C receptor were constructed, by recombination, based on the
CC company of the Abasic clones: NMDAR21 (07939), NMDAR22 (079400), NMDAR24
CC sequence of the 4 basic clones: NMDAR21 (07939), NMDAR22 (079400), NMDAR24
CC sequence of the 4 basic clones: NMDAR21 (07939), NMDAR22 (079400), NMDAR24
CC sequence of the 4 basic clones: NMDAR21 (07939), NMDAR22 (079400), NMDAR24
CC sequence of the 4 basic clones: NMDAR2 receptor contains two subunits:
CC subunit R1 (079370) and subunit R2 selected from the subunits R2
CC (079375), 2B (079377), 2C and 2D (079378). The receptor forms part of a
CC (079375), 2B (079370), and subunit R2 selective channels and bind
CC family of NNDA receptors which have cation-selective channels and bind
CC reconstruction of the NNDA receptor. The complete receptor can be used to

Human alpha-1B adrenergic receptor DNA (see T03128) was cloned into the EcoI site of eukaryotic expression vector pCEXV-3. The resulting plasmid was co-transfected with pGCcoS3neo into LM(tk-), CHO and NIH3T3 cells. Cell lines selectively expressing the receptor (R85943) were used to screen cpds. for antagonist activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             treating benign prostatic hyperplasia prostate tissue

Comparison of the N-terminal and central regions (W14533-57 and W14562-91) of PSPA polypeptides from different pneumococcal strains can be used to divide the strains into severa families based on sequence homologies. PSPA polypeptides, or fragments of them, can be used in vaccines to protect animals against S. pneumoniae infection and hence for the prevention of diseases such as otitis media, meningitis, bacteraemia and pneumon The sequence of the 3' half of the PSPA alpha-helical region and the immediate 5' tip of the coding sequence are likely to be the critical region and the control of the pspa alpha-helical region and the control of the coding sequence are likely to be the critical region.
                                                                                                                                                                                                                                                                                                                                                                       Claim 4; Page 34-38; 51pp; English.

A CDNA clone was obtd. (see T06027) from a HeLa cell cDNA library that encoded a novel density-enhanced Type III receptor-like PTP, designated hubEp-1 (R85203). hubEp-1 is useful for the study of PTPs and for the development of therapeutic or prophylactic cpds. e.g. for prevention of abnormal or malignant cell growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         09-NOV-1995.

CC (NMDAR2C). The NMDA receptor contains two subunits: subunit R1

CC (Q79370) and subunit R2 selected from the subunits 2A (Q79375), 2B

CC (Q79377), 2C and 2D (Q79378). The receptor forms part of a family of

CC (Q79377), 2C and 2D (Q79378). The receptor forms part of a family of

CC NMDA receptors which have cation-selective channels and bind glutamate

CC and NMDA. The NMDAR2C gene was obtained by amplifying cDNA derived from

CC human brain tissues with primers corresponding to sequences in the rat

CC NMDAR2A receptor DNA and using the resultant fragments as probes to

CC screen a cDNA library derived from human hippocampal RNA. 4 basic clones

CC were isolated: NMDAR2 (Q79399), NMDAR2 (Q7940), NMDA24 (Q79401) and

CC NMDAR26 (Q79402). The clones are thought to be splice variants of each

CC (Q79403-7) of the NMDAR2C receptor were constructed. The expression of

CC (Q79403-7) of the NMDAR2C receptor were constructed. The expression of

CC the genes allows the reconstruction of the NMDAR receptor. The complete

CC to the human NMDA receptor.
PT Isolated DNA encoding a human N-methyl-D-aspartate receptor provided DNA encoding related receptor subunit.

PT subunit - used as probes in the identification and isolation of provided acids encoding related receptor subunits.

PS Claim 11: Page 99-104: 156pp; English.

PS Claim 11: Page 99-104: 156pp; English.

CC (NMDAR2C) gene clone NMDAR2C-delta15-124. This clone covers the same companies of the novel N-methyl-D-aspartate (NMDA) receptor companies and insertion of a.a. 591-5 and an insertion of 8 a.a. between a.a. 721-2 of the NMDAR2C protein companies of variants (079403-7) of the NMDAR2C protein constructed, by recombination, based on the sequence of the 4 basic clones: NMDA21 (079399), NMDA22 (079400), NMDA24 (079401) and NMDA26 (079402). The NMDA receptor contains two subunits: subunit R1 (079370) cand subunit R2 selected from the subunits 2A (079375), 2B (079377), 2C cand 2D (079378). The receptor forms part of a family of NMDA receptors which have cation-selective channels and bind glutamate and NMDA. The expression of the genes allows the reconstruction of the NMDA receptor. CT he complete receptor can be used to identify compounds which bind or are antagonistic to the human NMDA receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PT Isolated DNA encoding a human N-methyl-D-aspartate receptor subunit - used as probes in the identification and isolation of PT nucleic acids encoding related receptor subunits.

Claim 11; Page 99-104; 156pp; English.

CC The nucleotide sequence of the novel N-methyl-D-aspartate (NMDA) receptor CC (NMDAR2C) gene clone pCMV-26-ScaI-24. This clone covers the same CC sequence as the NMDAR2C sequence and contains an insertion of 8 a.a. CC between a.a. 722-8 of the NMDAR2C protein (R66035). A series of variants (C 279403-7) of the NMDAR2C receptor were constructed, by recombination, CC based on the sequence of the 4 basic clones: NMDA21 (079399), NMDA22 (079400), NMDA24 (079401) and NMDA26 (079402). The NMDA receptor CC contains two subunits: subunit R1 (079370) and subunit R2 selected from CC the subunits 2A (079375), 2B (079377), 2C and 2D (079378). The receptor CC channels and bind glutamate and NMDA. The expression of the genes allows CC used to identify compounds which bind or are antagonistic to the human CC unda receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 42.617; Variance 98.163; scale 0.434

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
